➤ **Introduction:**

The experience to learn how we can make simulation for the (conduction or convection or radiation) and make all of this in the Solid work And from the Solid work I make my project. My project is from five poles put it until the holes of the bases. The poles made of (Silver, Copper, Aluminum, Brass, Nickel) and how transmission the heat in the materials

➤ **Objectives:**

The objective of the project how to make simulation in solid work and how the hat transmission in the materials.

➤ **Methodology:**

The methodology is a simulation of the heat transmission in the materials And the calibration of the heat

➤ **Equipment:**

- 1) Bases
- 2) Five poles
 - a) Aluminum
 - b) Brass
 - c) Capper
 - d) Silver
 - e) Nickel

➤ Procedures:

First: make the base

Second: make five holes at the same diameter

Third: make five poles

Forth: put the poles until the holes

➤ Simulation

The full project in the solid work

The base

The poles

➤ Rules

Graph

a) Aluminum

b) Brass

c) Copper

d) Silver

e) Nickel

Obstacles:

- 1) The first obstacle is when I assembly my project it is nor running I do not know what happened
- 2) The second thing is I do not know how to make a thermal Simulation but in the end I get it
- 3) In the end. The biggest thing is how to choose the mettles
And how to simulation it in solid work
